

RETROFIT**Upgrade 35.4**

The lifetime care programme of Stork recognises various facilities

Updating and retrofit

Technical development does not stand still. New materials, more sophisticated computer systems and additional insights in techniques and systems spawn improvement in design and construction of new installations.

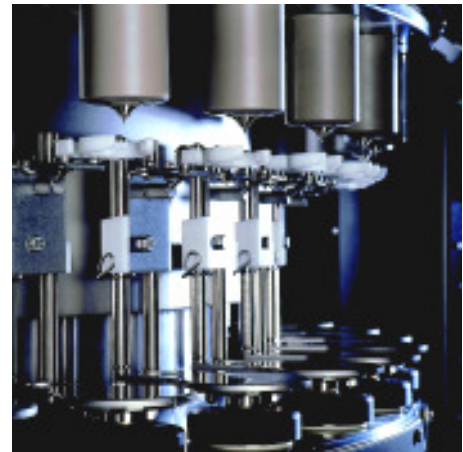

For existing installations to benefit from these developments a large number of modification and expansion packages have been developed thus allowing existing systems to be updated.

Neck Handling With Neck Grippers

Every Stork customer wants to reduce maintenance on bottle centring devices.

Therefore Stork has developed food grade plastic neck grippers to replace the spring type. With a few exceptions, an upgrade package to equip all Stork fillers that utilise neck handling can be made available.

This special plastic neck gripper assumes the task, which was originally performed by mechanical springs resulting in reduced operating costs.

Advantages of the neck gripper

- Broken springs no longer occur, machine downtime for replacing broken springs is a thing of the past.
- The neck grippers have no springs or bearings and therefore maintenance free.
- Food grade plastic neck grippers are easier to clean.
